

ROXANE

PRODUCT REVIEW

Sampling & Small Size Prod

Roxane K Line

The Roxane K Line is a modular machine designed for sampling and small and medium size productions. Its architecture allows it to be adapted to any workshop configuration and to be coupled in a simple and economic way with larger volume production equipment.

Qualité & précision

Thanks to its highly sophisticated VDS-101 valve control process, each dosage is performed very accurately and repeatedly within the imposed tolerance window. The system eliminates the risk of cross-pollution between raw materials. All operations on the Roxane K Line are systematically tracked. The system adapts automatically and continuously to fluctuations in the working environment (temperature, tank filling) without any human action.

Configuration

The Roxane K line can handle an unlimited number of raw materials as well as several dosing robots working independently but simultaneously to increase its productivity. It uses 6 liters containers that are held on a production input conveyor, after receiving an identification barcode label.
